POSITIONING

How ERIO sits alongside your GRC

GRC proves you complied. ERIO tells the board what to decide next. Two layers, one closed loop from signal to evidence.

What your GRC already does	What ERIO layers on top
▪ Maintains policy libraries and control registers	+ Ingests live signals from SIEM, GDELT, sanctions and suppliers
▪ Runs audit workflows and evidence collection cycles	+ Scores every signal against a 9-theme risk ontology
▪ Tracks attestations and owner sign-off across the organisation	+ Quantifies £ exposure using Open-FAIR Monte-Carlo simulation
▪ Proves to regulators that you complied	+ Produces a board briefing with tamper-evident audit trail
▪ Answers the question: did we comply?	+ Answers: should the board decide anything differently today?
	+ Delivers locale-aware output in English, French, German and Spanish

CLOSED LOOP · SIGNAL · DECISION · EVIDENCE

GRC holds the controls, policies and attestations. ERIO watches the outside world, prices the exposure in pounds and tells the board what has changed. Decisions flow back into your GRC as evidence, with a tamper-evident trail. Signal becomes decision, decision becomes record, and the record informs the next signal. Nothing falls between the two.

"You don't replace your GRC. You give it a decision layer that sees ahead."
